

Lesson 9: Sterling B2B Integrator Mapping

Sterling B2B Integrator Mapping

This lesson provides you an overview of Sterling B2B Integrator Map Editor, WebSphere Transformation Extender, and the XML Encoder Object Map Function.

This lesson has been designed to:

- Give you the basic understanding of the Map Editor
- Allow you to download and install the Map Editor.
- Allow you to understand the XML Encoder Object Map Function.
- Use WebShpere Transformation Extender maps in IBM Sterling B2B Integrator

The Map Editor

The Sterling B2B Integrator Map Editor

To translate data from one format to another, you must specify how the data in one format relates to data in another format. To relate one format to another for the translator, you must define a set of instructions in the Map Editor. These instructions indicate the relationship between the two formats.

The Map Editor is a stand-alone Windows program that you download from Sterling B2B Integrator. The Map Editor enables you to create maps (.mxl) and compile them into either translation objects (.txo.) or XML encoder objects (.ltx). After you have created and compiled maps, you check them in to Sterling B2B Integrator. The Sterling B2B Integrator Map Editor is shown below. It is used to represent the translation of one type of input data to a different type of output data.

Map File Types

Source maps

Source maps are editable copies of your map that you work on while building your maps.

There are two types of source maps:

- **.map** - This is a map file extension type that was common in Sterling Gentran.
- **.mxl** - This is an XML based map save file. It is not limited to xml type data and can be used with any data type such as flat files or EDI.

Note: There is no performance difference between either save format, and no difference while working with either type in the map editor.

Compiled Translation Objects

The translation objects (files with a .txo extension) and XML encoder objects (files with a .ltx extension) are the compiled translation maps.

The compiled maps are what is executed by B2Bi at business process execution.

- **.txo** - This is the most common of the translation objects. It is considered the fullweight translation object. Both sides of the map (source and output) must be defined. Use this type of map compilation for data translation from one data type to another. Used with the Translation Service and other services.
- **.ltx** - Lightweight translation object. This compiled object can only be use with the XML Encoder service. Is designed to add XML tags to a defined source data format for use in a business process's process data. It will not map data to different locations or alter it.

The Sterling B2B Integrator Map Editor (continued)

The Map Editor window enables you to navigate in four ways:

- Select the command from the Main Menu bar.
- Click the appropriate button on the Main toolbar.
- Click the appropriate part of the map.
- Right-click a map component to access a shortcut menu that contains all the available functions for that map component. The shortcut menus enable you to quickly and easily access available functions. The content of the shortcut menus varies, depending on the type and level of the selected map component.

When you start the Map Editor, the Main Menu bar contains a subset of commands. The full set of commands opens after you create a new map or open (load) an existing map.

EDI Map Components

Here are some of the components that make up your EDI Map:

Root Element

Group

Segment

Element

Composite

Your Student Manual has descriptions for each of the elements.

Exercise 9–1: Downloading and Installing the Map Editor

Exercise 9–2: Downloading EDI Standards

Your turn!

*Pause this presentation, and follow the steps for exercise 9-1.
Then read the Scenario, and follow the instructions for
Exercise 9-2*

XML Encoder Object Mapping Function

XML Encoder Object

The XML encoder object is a compiled map that translates positional, variable-length-delimited, CII, and EDI data formats into XML. It has the extension .ltx. To create an XML encoder object, you select Compile XML Encoder from either the input or output side of an EDI or positional file. Use the XML Encoder Object

Mapping Function with the XML Encoder Service allows the software to write non-XML data into process data. Once in process data we can then write XPath expressions. Because we need to convert non-XML data into XML we need to create a map to perform this task.

Exercise 9–3: Create the XML Encoder Object Map

**Exercise 9–4: XML Encoder Object Mapping
Function Converting EDI Data Into Process Data**

Your turn!

Pause this presentation, and follow the steps for exercise 9-3. Then read the Scenario, and follow the instructions for Exercise 9-4

WebSphere Transformation Extender

Introduction

WebSphere Transformation Extender (WTX) is a separate translation software application. It is part of IBM's Advanced ITX solution along with B2B Integrator.

WebSphere Transformation Extender is a powerful, transaction-oriented, data integration solution that automates the transformation of high-volume, complex transactions without the need for hard coding. This provides enterprises with a quick return on investment. This product supports EDI, XML, SWIFT, HIPAA standards that are based on B2B integration, as well as the real-time integration of data from multiple applications, databases, messaging middleware, and communications technologies across the enterprise.

WTX maps are designed to be built and then deployed throughout your enterprise and are compatible with different IBM solutions. IBM Sterling B2B Integrator is one of the solutions WTX maps are compatible with.

WTX for Sterling B2B Integrator

The integration of WebSphere Transformation Extender with Sterling B2B Integrator provides the following capabilities.

- Trading partner management
- Enveloping and de-enveloping or bulking and de-bulking
- Document management and archive
- Automated acknowledgment generation
- Reporting
- Managed file transfer with Sterling File Gateway

WTX Map Service

In order for WTX maps to operate in Sterling B2B Integrator the WTX map service needs to be added. The WTX map service can be found with installations of WTX 8.4 or later. You need to have a licensed installation of WTX in order to have access to the service.

Knowledge Check

**Please pause this presentation and
complete the Quiz in your Student
Manual.**

Congratulations !!!!!!

Completed Lesson Objectives -

This lesson was designed to enable you to:

- Basic understanding of the Map Editor
- Download and Install the Map Editor
- Understand the XML Encoder Object Map Function
- Use WTX maps in Sterling B2B Integrator
