

Lesson 10: Typing Map

Objectives

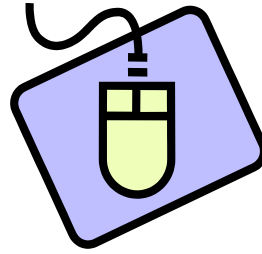

This lesson is designed to help you:

- State the purpose of the typing map and the typing service
- Create a typing map

Overview

- A business process is capable of handling more than one input format. A typing (Type of Data) map for Sterling B2B Integrator can be used to identify the data and process it correctly.
- A typing map can also place specific values from the input file into Process Data. It works with the Typing Service to load these values into the business process context. The Typing Service can be used with a **list** of typing maps. The service will work through the different maps till it finds a match in the limited data set used in the typing map.
- The typing map specifies certain values on the input side that are to be placed into Process Data. The output side of the typing map defines only the elements that are created in Process Data. You define the output side of the map as XML. The element names you list will be the tag names in Process Data, while the data that passes from the input side via simple links will be the content of those elements. Commonly these values are used to locate document envelopes for EDI but can be used for other business processing needs.
- The values that you pass into Process Data can also be hard-coded, if appropriate. You can do this using either standard or extended rules.

Exercises 10–1 to 10-5: Creating a Typing Map, Output side of a Typing Map, Simple links, an Extended Rule and Checking in the Typing Test Map

Your turn!

Pause this presentation, read the scenarios and complete the exercises for Creating a Typing map, Creating the Output side of a Typing Map, Establishing simple links, Creating an Extended Rule and Checking in a Typing Test Map. 10-1 to 10-5

Lesson Review

Congratulations !!!!

This lesson was designed to help you to:

- State the purpose of the typing map and the Typing Service
- Create a typing map
