

Lesson 4

Mailbox Management

Lesson objectives

- Describe Sterling B2B Integrator mailboxes.
- Identify the location of the producer and consumer mailbox.
- Extract data from a mailbox of producer and consumer.
- Explain the importance of global mailbox in Sterling File Gateway.

Sterling Integrator Mailboxes

- The Sterling Integrator Mailbox system is a secure business document repository with a store-and-forward communication infrastructure.
- In addition, the Sterling Integrator Mailbox provides a trading partner browser interface called the Mailbox Browser Interface (MBI). The MBI is secure and simple to use, requiring no special user training.
- **Sterling Integrator Mailbox Components**
 - MBI
 - Messages
 - Mailbox
 - Archive

Mailbox Browser Interface

- **The Mailbox Browser Interface (MBI)** enables Internet users to securely access their mailboxes from a standard Web browser. The MBI is a Web application and therefore requires only a browser.
- Users can send messages to, retrieve messages from, and search messages in any mailbox for which they have permissions.
- The MBI enables users to change their account password.

Mailbox Browser Interface

(Contd..)

http://192.168.40.100:9000/mailbox

The screenshot displays the Mailbox Browser Interface (MBI) web application. The browser window title is "Mailbox Interface MBI". The page header features the "IBM Sterling B2B Integrator" logo. A navigation bar on the left includes a "Welcome fg_sysadmin" message and a menu with the following items: "Admin Console Home", "Mailbox Search" (highlighted), "Mailbox Send", "Change Password", "Log Out", "Refresh Mailboxes", and "Help". The main content area is titled "Mailbox Search" and contains a "Search Options" section. This section includes input fields for "Mailbox: /", "Message Name", and "Message ID". It also features a "Creation Date:" section with "From:" and "To:" filters, each with date, time, and time zone (PM) dropdowns. A "Go!" button is positioned below the "To:" filter. On the right side of the "Search Options" section, there is a "MailboxPath lookup (1 - 5 of 16)" section with a "Filter" input field, an "Items per page: 5 10 25" dropdown menu, and a link labeled "All undefined".

Tips

Getting Started

Just as you use a road map to determine the best route through the countryside, you can use a business processes to find the best route through critical business systems, such as purchasing, inventory status, and invoicing.

Mailbox Messages

Messages : Business documents stored in the Sterling Integrator Mailbox are called *messages*.

Mailbox :

- *A mailbox is a storage area for business documents and provides an administrative hierarchy that is easy to manage and understand.*
- Mailboxes form a hierarchy. The top of the hierarchy is called the root mailbox and is denoted by a slash (/). Mailboxes are able to support sub-mailboxes.

A key function of Sterling File Gateway is the routing of files from one mailbox to another. Sterling File Gateway uses the mailbox system within the Sterling Integrator application for its routing of messages.

Mailbox Creation

Mailboxes used for Sterling File Gateway operations can be created automatically in the following circumstances:

- When a Partner is created in Sterling File Gateway
- When Partners are migrated from Advanced File Transfer
- When Partners are imported into Sterling Integrator
- When a Routing Channel is created
- At file transfer runtime (using dynamic routing channel templates)

Mailbox Routing Rules

- Routing rules provide a powerful and easy-to-use mechanism for controlling document routing.
- You can create routing rules to initiate action automatically when a message is added to a mailbox. Automatic routing assures that the rule is evaluated at least once. When a message is added to a mailbox, any rules established for the Sterling Integrator Mailbox are evaluated automatically.
- Routing rules consist of two parts: a pattern to specify when the rule applies, and an action to be performed.

Routing Rule Evaluation Mode

- When a routing rule is evaluated, Mailbox searches the mailboxes defined in the rule for message names that match the pattern defined in the rule.
- When a match is found, the routing rule notifies the business process or contract specified in the routing rule.
- Depending on how the business process is defined, it may extract and process the message, extract the message and pass it to another application for processing, or notify another application to extract and process the message.

Additional Mailbox Information

Disable Duplicate Messages:

1. In the `install_dir/properties` directory, locate (or create if necessary) the `customer_overrides.properties` file.
2. Open the `customer_overrides.properties` file in a text editor.
3. Add the following parameter: *mailbox.disallowDuplicateMessages=true*

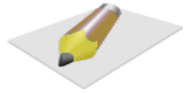

Distributed mailbox

IBM Global High Availability Mailbox is an add-on component of IBM Sterling B2B Integrator and is robust and reliable to store and replicate message data from partners across any geography.

Current approaches to provide high available B2B and MFT environment:

- Shares payload across data centers at the communications layer for various protocols.
- Asynchronous or Synchronous data replication is configurable by mailbox.
- A consistent view is provided across data centers of what files get processed and where regardless of data center status.
- Transaction processing is balanced across distribution centers.
- Integration with Control Center v6.1 to monitor system health.

Exercise

1. Locate Mailboxes
2. Enable Routing Rule Schedule
3. View disabled duplicate message

Completed lesson objectives

- Describe Sterling B2B Integrator mailboxes.
- Identify the location of the producer and consumer mailbox.
- Extract data from a mailbox of producer and consumer.
- Explain the importance of global mailbox in Sterling File Gateway.
