

Lesson 2

File Layers

Lesson objectives

- Explain the importance of file layers in Sterling File Gateway.
- Discuss to add custom file layer in Sterling File Gateway.
- Explain to extract compressed file layer.
- Create a routing channel template and routing channel for layered file.

Introduction

- In Sterling File Gateway, File Layers are used to describe the layers or wrappings around the innermost file.
- Sterling File Gateway uses the file layer description to transform the producer file into a format that meets the consumer's business requirements.
- This file brokering capability enables significant file transfer flexibility.

Introduction

(Contd..)

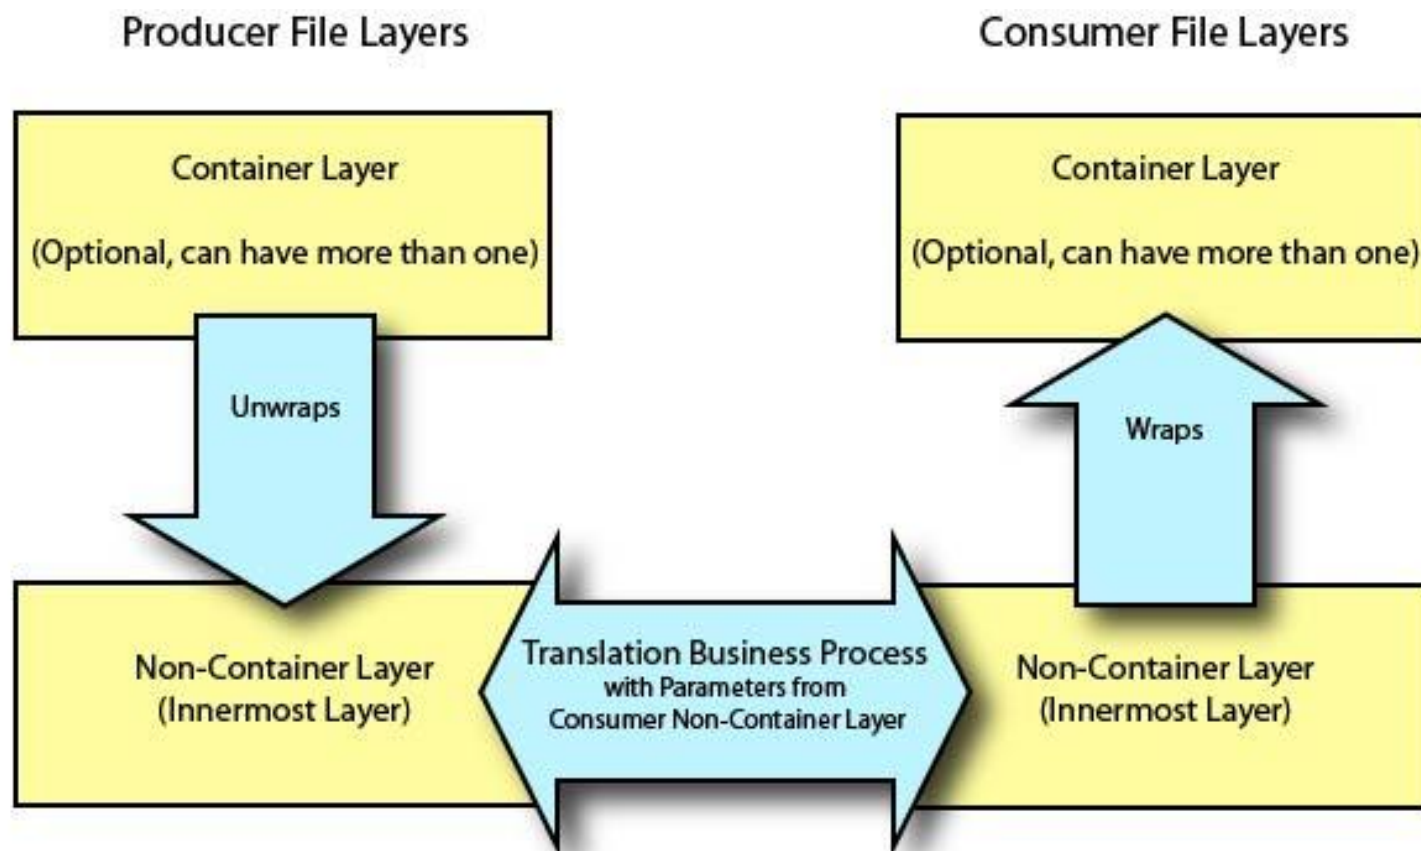

- Routing channel templates use file layer types to describe producer and consumer file structures.
- The following file types are supported:
 - Container Layer
 - Non Container Layer
- Sterling File Gateway uses the file layer descriptions to transform the producer file into a format that meets the consumer's business requirements.
- This file brokering capability enables significant file transfer flexibility. If the producer file does not fit the description in the routing channel template, the file is not routed

Container and non-container file layers

- **Container type layers** : contain other container or non-container layers.
For example, a PGP layer can contain a ZIP layer and a ZIP layer can contain a TEXT layer. A zip file can only contain multiple files if it is the outermost layer. The standard container types are:
 - ZIP
 - GZIP
 - PGP
- **Non-container type layers** - or primitive, do not contain any nested layers.
The standard non-container layers are:
 - Text
 - Unknown

Layer	Type	Description	Contains other files
Container	ZIP	a file with a *.zip extension	Yes
	GZIP	a file with a *.gzip extension	Yes
	PGP	a file with a *.pgp extension or a *.asc extension (to represent PGP with ASCII armor turned on)	Yes
Non-Container	TEXT	a file with a *.txt extension	No
	UNKNOWN	any type of file	No

File layer communication

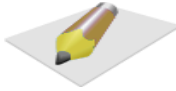

File layer description

Type	Description	Contains Other Files
ZIP	For example, a file with a *.zip extension.	Yes
GZIP	For example, a file with a *.gzip extension.	Yes
PGP	For example, a file with a *.pgp extension or a *.asc extension (to represent PGP with ASCII armor turned on).	Yes
TEXT	For example, a file with a *.txt extension.	No
UNKNOWN	Any type of file.	No

	Consumer File > TEXT	Consumer File > UNKNOWN
Producer File > TEXT	Good	Good
Producer File > UNKNOWN	Bad	Good

Exercise

1. Unwrap an inbound compressed files into a text file.

Completed lesson objectives

- Explain the importance of file layers in Sterling File Gateway.
- Discuss to add custom file layer in Sterling File Gateway.
- Explain to extract compressed file layer.
- Create a routing channel template and routing channel for layered file.

Questions
