

Lesson 2

Users and Trading Partners

Lesson objectives

- Explain the importance of users in Sterling File Gateway.
- List built in users of Sterling File Gateway.
- Explain about communities, groups and trading partners.
- Create communities, groups, partners and users.

Sterling File Gateway Persona

- Sterling File Gateway users are described as user accounts. Inherently, each user account has different access levels to Sterling File Gateway and may have different landing pages in Sterling File Gateway as per their permissions.
- There are five different user accounts in Sterling File Gateway:
 - System Administrator
 - Integration Architect
 - Route Provisioner
 - Operator
 - Partner User

System Administrator

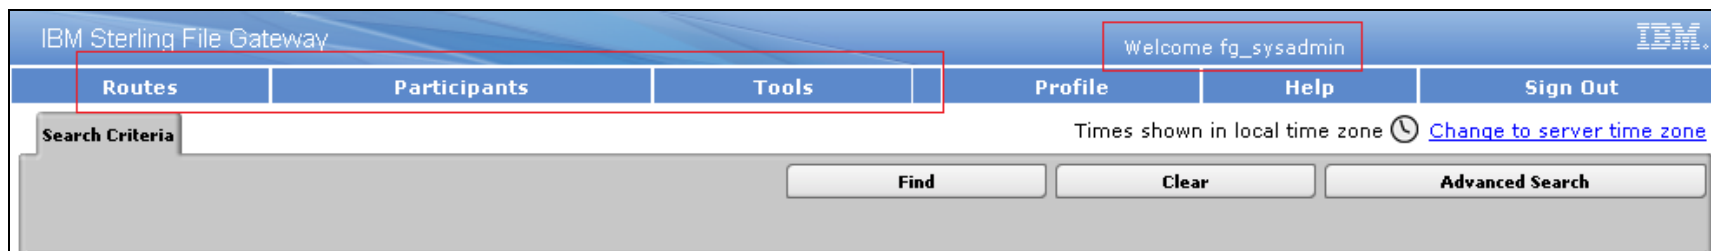

System Administrator

- Installs and maintains system software.
- Creates initial administrative users.
- Configures services and adapters for sending and receiving files.

User : <Partneruser>

Password : <password>

Sterling File Gateway Persona

(Contd..)

- The *System Administrator, Integration Architect, Route Provisioner, and Operator* users are considered to be administrative users and members of the company that is using Sterling File Gateway to manage their file transfer business needs.
- The *Partner User* is not a member of the company that is using Sterling File Gateway. The *Partner User* is a member of a trading partner company and has access to only myFileGateway.

Communities

- A community represents a way to organize partners for purposes of on boarding in Sterling File Gateway.
- Communities are used to limit or widen the selection of protocols available when creating partners. They are also used to enable listening or initiating modes of connection.
- A community is required to create a partner.
- The community must exist before the partner is created.
- Integration Architects manage communities.

Communities

- We may have the following community categories:
 - FTP only
 - SFTP only
 - HTTP only
 - Connect:Direct only
 - Listening only
 - Initiating only

Groups

- Groups provide more flexibility than communities. Groups help a company to logically organize their partners according to the business needs of the company.

For example, you may have the following types of groups:

- Divisions or locations
 - File types
 - Encryption requirements
- Upon installation of Sterling File Gateway, a group named *All Partners* is created. By default, each partner is automatically associated with the All Partners group when they are created in Sterling File Gateway. The All Partners group cannot be deleted.

Groups

(Contd..)

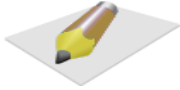

- Partners must be a member of at least one group. Partners can be a member of multiple groups.
- Assigning partners to groups allows the partners to participate in any transfers using templates where the group is specified.
- Groups allow a company to organize their trading partners by business needs. A trading partner can exist in more than one group, which makes Groups more flexible and allows companies to organize trading partners by business needs rather than imposing trading partner organization by protocol (as communities do).

Partners

- Sterling File Gateway enables the exchange of files between trading partners are called partners.
- Partners that send files into Sterling File Gateway are referred to as producers.
- Partners that retrieve files are referred to as consumers. A partner can be a producer, a consumer, or both from an operational standpoint.

Exercise

1. Community Creation.
2. Group Creation.
3. Partner Creation.
4. Attaching a partner to a group.

Completed lesson objectives

- Explain the importance of users in Sterling File Gateway.
- List built in users of Sterling File Gateway.
- Explain about communities, groups and trading partners.
- Create communities, groups, partners and users.

Questions
