

Lesson 6: Troubleshooting a Business Process

Lesson 6: Objectives

Introduction: A business process instance is a unique copy of a business process created when the business process is run within Sterling B2B Integrator. By monitoring business process instances, you can confirm whether they carry out their intended purposes.

Lesson objectives This lesson has been designed to enable you to:

- Check the status of a business process
- Search a business process
- View business process details
- Restart and resume a business process
- View execution information
- Terminating a business process

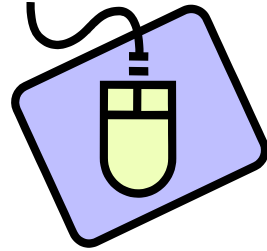

Viewing Active and Recent Business Processes

Sterling B2B Integrator provides general and detailed processing information. You can view processing information to monitor active and recent business processes instances to determine if any further action is required.

The Monitor page refreshes automatically and displays the 10 most recent instances of business processes to run and their processing information.

When monitoring active and recent instances, Sterling B2B Integrator shows two status indicators to indicate further action is required:

Status Indicator	Active Business Process	Recent Business Process
	Encountering no errors or warnings at this point of the execution.	Encountered no errors during execution.
	Waiting for other activities to complete before continuing execution. Encountering errors or warnings during execution.	Encountered errors or warnings during execution.

Searching for Business Processes and Other Information

Searching for Business Processes and Other Information

Sterling B2B Integrator has a Central Search Page that allows you to Search for Active Business Process instances that don't display on the monitor page and EDI Correlation matches.

You also have the ability to do an advanced search for:

- BPSS business flow transactions
- Active, archived, and restored business processes
- Document Tracking

Administration Menu

- Business Processes
 - Manager
- Monitor
 - Advanced Search
 - Central Search**
 - Current Processes
 - Current Documents
 - Current Activities
- Message Entry Workstation
- Trading Partner
- Deployment
- eInvoicing
- EBICS
- Operations
- Accounts

Searching for Current Service Activities

This section enables you to search for service activity by service type, service name, activity type, Not Updated Since date, or Started Before date.

To perform a search of service activity by following the steps listed below.

1. Select **Monitor > Current Activities** from the Sterling B2B Integrator Business Process menu.
2. Enter yesterday's date in the form MM/DD/YYYY in the Not Updated Since dialog box, and enter the time **01:00 (HH:MM)** Click **Go!**
3. View the list of the business process instances that match your search criteria in the Service Activity Search Results page.

instructions detailed in your Student Manual*

Restarting/Resuming a Business Process

Restarting or Resuming a Business Process

The Restart Business Process page opens after you select Resume or Restart in the Action field from the Business Process Detail page. This page has three options that enable you to determine how to run a business process again if it should stop running: Resume, Simple Restart, and Advanced Restart.

The Resume function restarts a business process from the last error step. The business process retains its original ID. Use this function when the error is related to services. For example, if a service is disabled unexpectedly, a business process using that service stops at that point. After the service is restored and active, you can resume the business process.

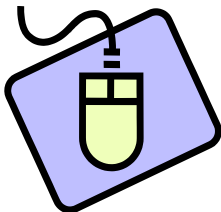

Important!! Resume only appears if the instance stopped in mid-execution.

Restarting a Business Process

The restart feature allows you to do a Simple restart or and advanced restart.

Simple: The Simple Restart function starts a new instance of a business process from the beginning. The new business process receives a new ID. Use this function when the error is related to an unplanned interruption of the business process. For example, if you have interrupted a business process while bringing down a server for non-routine maintenance, you can restart the business process after the server is restored by using the Simple Restart function.

Advanced: The Advanced Restart function runs the original document using a different version of the business process or another business process. The new instance receives a new ID. Use this function when the error is related to the business process BPML code. For example, if a business process has incorrectly routed a document through sequential services, you can modify the business process and enable a new version to correct the error.

Resuming a Business Process or Performing a Simple Restart and Performing an Advanced Restart

Business Process Detail

Viewing Execution Information

Viewing Execution Information

When you restart or resume a business process, Sterling B2B Integrator opens the Execute Business Process page. This page lists the service, status, advanced status, start and end times, troubleshooting reports, and documents for each step completed within a recently run business process.

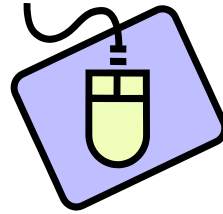

Status	ID	Name	State	Started	Ended	Deadline	Parent/Child	Expires
	38005		Completed	06/28/2011 9:51:52 AM	06/28/2011 9:51:55 AM	None	None	 info
	2598	Trans EDI PO Readable	Completed	12/09/2010 10:49:24 AM	12/09/2010 10:49:25 AM	None	None	 info
	500	Trans EDI Invoice Readable	Completed	10/22/2010 8:55:36 AM	10/22/2010 8:55:37 AM	None	None	 info
	491	Trans EDI PO Readable	Completed	10/22/2010 8:52:16 AM	10/22/2010 8:52:21 AM	None	None	 info

indicates that a troubleshooting report or document is available.

Terminating Business Processes:

If a business process stops running, you can also use the System Troubleshooter page to review the business process and terminate it when you see a status of waiting, interrupted, or halted. The System Troubleshooter page enables you to terminate processing for multiple business processes.

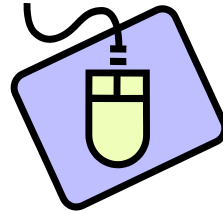

A process can also be terminated at the individual level from the action box above the process steps when viewing the execution results. It is the same box as is used for restarting a BP.
