

Lesson 5

Static Route

Lesson objectives

- Transfer files using Static Routing.
- Explain the different ways to upload a file in Sterling File Gateway.
- Edit and monitor Routing Channel result.
- Analyze the routes file transfer in myFileGateway and File Gateway.

Routing Channels

- Routing channels match incoming producer files to the appropriate consumer and then transform the file and file name according to the policies of the consumer.
- Route Provisioners create routing channels. Before routing channels can be created, the Integration Architect should create a routing channel template and the Route Provisioner should create the producer and consumer Partners.
- For a static routing channel, the consumer is explicitly identified during the configuration, and there is only one consumer.
- For a dynamic routing channel, no consumer is explicitly specified.

Creating a Routing Channel - Static

Myfilegateway

- Myfilegateway is a partner interface for the producer and consumer to upload and download files.
Characteristics of Myfilegateway are:
 - Upload or download files.
 - Search for routes
 - View recent activity and status for file transfers they participated in.
 - Generate reports for activity they participated in.
 - Generate PDF reports in Asian languages.
 - Subscribe to notifications.
 - View and update profile information.
- MyFileGateway requires access to a valid user account. This user account is created when a Route Provisioner creates the Partner.
- If you select a static template, select a producer and a consumer. If you select a dynamic template, select only a producer.

Visibility

You can view activity status information for the last hour, day, and week.

From the main menu, navigate to Tools > Activity Snapshot

The screenshot shows a window titled "Activity Snapshot" with a close button in the top right corner. The window contains a table with the following data:

	Total Arrived Files	Total Payloads	Unidentified Files	Successfully Routed	New Failures	Reviewed Failures
Last Hour	0	0	0	0	0	0
Last Day	3	3	0	3	0	0
Last Week	9	9	0	9	0	0

Below the table, there is a line item: Total in-flight: 0

Total in-flight lists the producer's arrived files currently being processed, These files have not yet moved to a completed state.

Replay and ReDeliver

Mailbox Services

- **Mailbox Extract Begin service** – Enables the extraction of messages from a mailbox.
- **Mailbox Extract Commit service** – Provides the ability for a business process to signal Sterling B2B Integrator Mailbox that the message extract request has successfully completed.
- **Mailbox Query service** – Enables querying messages.
- **Mailbox Delete service** – Enables deletion of messages.
- **Mailbox Evaluate All Automatic Rules service** – Provides for the scheduling of automatic routing rules for Sterling B2B Integrator Mailbox.
- **Mailbox Evaluate Routing Rule service** – Enables triggering of mailbox routing rules from a business process.

Exercise

1. Create a routing channel
2. Upload a file using myfilegateway
3. Analyze uploaded file transfer
4. Creating a listening partner
5. Set up directories in FTP
6. Upload file to initiate FTP process
7. Disable FTP configuration from listening partner
8. Extracting data from mailbox repository using a business process.

Completed lesson objectives

- Transfer files using Static Routing.
- Explain the different ways to upload a file in Sterling File Gateway.
- Edit and monitor Routing Channel result.
- Analyze the routes file transfer in myFileGateway and File Gateway.

Completed unit objectives

- Explain the Sterling File Gateway application terms and concepts.
- Discuss the Sterling File Gateway installation.
- Explain users, trading partners groups and communities.
- Create routing channel template and routing channel for static route.

Questions
